6 Progress of current Milestone

Task	% Completion	Ryan	Eric	Josef	To Do
Repair MTS Data Collection	100%	40%	40%	20%	none
Install DATE and AMORE	100%	40%	20%	40%	none
Install ROCKS	50%	30%	10%	10%	boot into ROCKS
something about GEM _i	100%	40%	30%	35%	none

7 Discussion - Current Milestone

7.1 Existing MTS Progress

At the beginning of this Milestone, the MTS was unable to collect data due to software issues. We were able to locate the faulty script and edit it accordingly to eliminate the issue. This, however, brought to light a hardware problem: one of the Front End Controllers (FECs) was not transmitting any data. After some troubleshooting, it was determined that the FEC was working properly, but its Analogue to Digital Converter (ADC) was not. Fortunately, we had an extra ADC, so we replaced the faulty component. The MTS is now capable of taking data! Data collection is not entirely fixed, however. There are some software issues regarding how the data is processed and some hardware issues regarding the data collection detectors.

7.2 Development MTS Computer Progress

Our first challenge was to find the repository from which we could obtain the software to be installed, DATE and AMORE. While AMORE was present in the CERN CentOS 7 repository we had access to, DATE was not. The latest version of DATE is only found in the CERN Scientific Linux 6 repository. Since we did not have that repository, we manually created the repository file using the CERN CentOS 7 file as a blueprint; we changed all instances of `cc7` (**CERN CentOS 7**) to `slc6` (**Scientific Linux CERN 6**). Miraculously, we were able to access the repository and install the software we needed! The current challenge is installing the drivers for the MTS's hardware.

7.3 Computing Cluster

The cluster continues to be an incredible challenge. Since the Anaconda installer does not recognize the internet while on the cluster, we figured it might on another machine. As long as ROCKS is installed properly onto a drive, we can copy everything over to the cluster's drives. We loaded the installer onto a separate machine and attempted to install ROCKS onto a flash drive. While Anaconda recognized the internet and began the installation process smoothly, it failed partway through. It does not seem this method will work.

For the sake of investigation, I loaded a Ubuntu LiveCD onto the cluster to examine the contents of the drives, and what I found surprised me. There are CentOS 7 images loaded onto the drives already in the cluster! Perhaps the original installation was not completely botched. The drives are having a very hard time booting, however, so the next step is to investigate GRUB, the boot loader.

7.4 GEM Machines

8 Parts Worked On

8.1 Josef Bostik

- software installation on development MTS computer
- software configuration on development MTS computer
- software repair of existing MTS computer

8.2 Eric Pereira

- test hard drives for the compute cluster and GEM machines
- software repair of existing MTS computer
- hardware repair of existing MTS computer

8.3 Ryan Wojtyla

- troubleshooting the computing cluster
- hardware repair of existing MTS computer
- software installation on development MTS computer

9 Task Matrix - Next Milestone

Task	Ryan	Eric	Josef
Repair the existing MTS.	30%	40%	30%
Install hardware drivers onto the development MTS machine.	40%	40%	20%
Boot the cluster into ROCKS.	80%	10%	10%
Continue setting up the GEM team's machines.	15%	70%	15%

10 Discussion - Next Milestone

10.1 Existing MTS

Although the MTS is once again (mostly) capable of collecting data, it is having trouble processing it. A script is run on the raw data file that transforms the data into a form usable by data visualization tools, namely ROOT. The processed data, however, is not being stored in the expected location, or any location for that matter. The current challenge is to diagnose the issue and remedy the situation.

10.2 Development MTS Computer

With the required software installed, the next step is to prepare for the attachment of MTS hardware. The installation of the drivers for that hardware, however, is proving to be quite an obstacle. Throughout the software installation, we have been following a guide put together by a researcher setting up a system similar to our own. While he experienced issues while installing his drivers, ours are different. The current challenge is to figure out what is wrong with the system's configuration that is preventing the drivers from being installed.

10.3 Computing Cluster

With the discovery of CentOS 7 images on the cluster's drives, the question has changed from "How do we install ROCKS onto the cluster?" to "How do we get the cluster to boot into ROCKS?". We have been conducting extensive research into the operation of the boot loader, GRUB, so that we can better understand how a working system is constructed in order to more

effectively diagnose booting issues on the cluster. The current challenge is to load ROCKS from the cluster's drives.

10.4 GEM Machines

The GEM computers are optimal for the most part with very minor issues. All the parts are working, resources have been allocated successfully, drivers are optimized and working. Currently the largest issue is with one of the computers (named Charm) has issues connecting to a keyboard on occasion. This is a strange bug, and resetting usually fixes the problem, however it, on the occasion, will have this error. It is unknown whether this is a hardware or software issue, will be investigated.

11 Sponsor Feedback

11.1 Existing MTS

11.2 Development MTS Machine

11.3 Computing Cluster

11.4 GEM Computers
