7 Discussion - Current Milestone

7.1 Existing MTS Progress

Part way through the month, one of the MTS's Front End Controllers (FECs) failed to transmit any data; it was broken. Fortunately, we had a spare FEC that we could put in its place. Unfortunately, however, this FEC was of a different model, and it was not working properly with the

rest of the hardware. After some troubleshooting, it was determined that this newer FEC has a newer version of firmware that is incompatible with the older version installed on the other FECs. Since we do not have the firmware's binary laying around, we are asking former graduate students and other researchers familiar with the MTS if they happen to have a copy to send us.

7.2 Development MTS Computer Progress

While trying to use the required software we had just installed, namely AMORE, it became apparent to us that there were some serious compatibility issues. Turns out, the latest version of AMORE depends not on the latest version of ROOT, ROOT 6, but the previous version, ROOT 5. After we had discovered this issue, we began the task of uninstalling ROOT 6 and installing ROOT 5. The process of installing ROOT 5 presented us with another issue: it was having a hard time building. After some troubleshooting and research, we discovered that we were simply attempting to build the software in the incorrect directory. With this solved, ROOT 5 was built and it is installed. AMORE, however, is still giving us trouble.
